

JACKY BIN BAGGING STATION

Designed and constructed to facilitate the bagging of feed and grain mixes, this weigh station is extremely versatile and functional.

The bulk hopper is removable to allow easy filling from a silo or feed mixer. Once full (approx. 2T capacity) it is placed back over the smaller dosing hopper, and the desired dosing weight (e.g. 20kg) is preset via the digital control panel.

Upon activation, an air operated cylinder opens the bulk hopper and discharges the desired amount of product into the dosing hopper before automatically closing. The dosing hopper is manually emptied into bags or buckets as required.
